

## Danger Level 1 - Low

**Tendency: Increasing avalanche danger**  
on Tuesday 29 03 2022

Wet snow

A mostly favourable avalanche situation will prevail.

A clear night will be followed by favourable avalanche conditions mostly. As the day progresses as a consequence of warming during the day and solar radiation there will be a gradual increase in the danger. From the middle of the day individual small and, in isolated cases, medium-sized wet and gliding avalanches are possible. This applies on rocky sunny slopes in all altitude zones. Moist avalanches can be released by people or triggered naturally.

### Snowpack

The conditions remain spring-like.

As a consequence of low relative humidity a crust will form on the surface during the night.

Shady slopes: The snowpack is largely stable and its surface has a melt-freeze crust that is strong in many cases. Sunny slopes: The snowpack will become wet all the way through as the day progresses.

### Tendency

Gradual increase in avalanche danger as a consequence of the precipitation.
