

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
on Monday 12 02 2024

Wind slab

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **medium**

Fresh wind slabs require caution. The avalanche danger in particular at high altitude is within the uppermost range of danger level 2 (moderate).

In particular adjacent to ridgelines on northeast, east and south facing slopes the wind slabs have increased in size substantially as the day progresses. As a consequence of new snow and a light to moderate northwesterly wind, further wind slabs will form by late in the night. The avalanches are rather small but can be released easily by a single winter sport participant. Individual medium-sized avalanches are nonetheless possible. At high altitude the avalanche prone locations are more prevalent and the danger is greater.

Backcountry touring and other off-piste activities call for experience in the assessment of avalanche danger and caution.

Snowpack

In some regions up to 25 cm of snow has fallen since Friday. The sometimes strong wind has transported the new snow significantly. The wind slabs are lying on the unfavourable surface of an old snowpack in particular on shady slopes.

Up to 10 cm of snow will fall until late in the night above approximately 1000 m. In the next few hours the wind will be light to moderate.

Tendency

Monday: The danger of dry avalanches will decrease gradually. Increase in danger of gliding avalanches and moist snow slides as a consequence of warming during the day and solar radiation.
