

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger** →  
on Saturday 1 March 2025

Wind slab

Treeline

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **small**

The no longer entirely fresh wind slabs represent the main danger.

The no longer entirely fresh wind slabs of Wednesday must be evaluated with care and prudence in particular on very steep shady slopes at intermediate and high altitudes. The avalanche prone locations are to be found in particular in gullies and bowls, and behind abrupt changes in the terrain and adjacent to ridgelines and in pass areas. Mostly they are small but in some cases easily released. Released avalanches and shooting cracks when stepping on the snowpack have shown poor snowpack stability on very steep north and east facing slopes.

Backcountry touring and other off-piste activities call for meticulous route selection. The wind slabs will be covered with new snow in some cases and therefore difficult to recognise.

### Snowpack

The no longer entirely fresh wind slabs of Wednesday remain in some cases prone to triggering. They are lying on weak layers in particular on north and east facing slopes. The wind slabs have bonded poorly with each other and the old snowpack. On Friday it will be sunny at times.

Especially on sunny slopes at low and intermediate altitudes hardly any snow is lying.

### Tendency

Some snow will fall on Saturday. Slight increase in danger of dry avalanches.
