1500m

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **small**

New snow and wind slabs as the day progresses.

The more recent wind slabs can be released easily, or in isolated cases naturally, at intermediate and high altitudes. Especially on very steep slopes and in shady places that are protected from the wind dry snow slides are to be expected. The avalanches are rather small.

The older wind slabs can be released in particular on steep shady slopes at high altitude. In particular adjacent to ridgelines these are in some cases medium-sized.

Careful route selection is important. The avalanche prone locations are barely recognisable because of the poor visibility.

Snowpack

Over a wide area 15 to 20 cm of snow fell in the past few hours. 15 cm of snow, and even more in some localities, will fall until the early morning. The wind will be strong to storm force adjacent to ridgelines especially at the southern and eastern borders of Aran.

Shady slopes high altitudes: Towards its base, the snowpack is faceted.

In particular at elevated altitudes snow depths vary greatly, depending on the influence of the wind.

Tendency

Slight decrease in avalanche danger as the precipitation eases.
