

Danger Level 1 - Low

Tendency: Constant avalanche danger →
on Wednesday 27 12 2023

Wet snow

Snowpack stability: **poor**

Frequency: **few**

Avalanche size: **small**

Moist snow slides and gliding avalanches are possible in isolated cases as before.

The avalanche conditions in the morning, after a clear night, are favourable. As a consequence of warming during the day and solar radiation individual gliding avalanches and moist snow slides are possible as the day progresses, but they will be mostly small. The avalanche prone locations are to be found in particular on very steep sunny slopes above approximately 2000 m. Even a small avalanche can sweep people along and give rise to falls.

Snowpack

The snowpack is largely stable and its surface has a melt-freeze crust. Boxing Day: Sunshine and high temperatures will give rise as the day progresses to increasing moistening of the snowpack on very steep sunny slopes. In particular shady slopes: In steep terrain there is a danger of falling on the icy crust. At high altitude there are 30 to 50 cm of snow. In all regions snow depths vary greatly, depending on the influence of the wind.

Tendency

Wednesday: The avalanche conditions remain favourable.
