

Danger Level 3 - Considerable

Tendency: Constant avalanche danger →
on Sunday 31 03 2024

Wind slab

Snowpack stability: **very poor**

Frequency: **some**

Avalanche size: **medium**

New snow

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **small**

Wind slabs represent the main danger.

The fresh and somewhat older wind slabs can be released easily, or in isolated cases naturally, in particular on shady slopes and at high altitudes and in high Alpine regions. Sometimes the avalanches are medium-sized. The avalanche prone locations are to be found especially adjacent to ridgelines above approximately 2400 m and in gullies and bowls, and behind abrupt changes in the terrain.

As a consequence of the snowfall, the likelihood of dry avalanches being released will increase a little in all aspects above approximately 1800 m. The avalanches in these regions are rather small but in many cases easily released.

Backcountry touring and other off-piste activities call for careful route selection.

Snowpack

20 to 50 cm of snow, and even more in some localities, fell in the last five days. In some localities 5 to 10 cm of snow will fall until the evening above approximately 1800 m. The southerly wind will transport the new snow and, in some cases, old snow as well.

The new snow and wind slabs have bonded well with the old snowpack in all aspects. At high altitudes and in high Alpine regions snow depths vary greatly, depending on the influence of the wind.

Tendency

Sunday: Slight increase in danger of dry avalanches as a consequence of new snow and wind.

Danger Level 2 - Moderate

Tendency: Constant avalanche danger →
on Sunday 31 03 2024

Wind slab

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **medium**

New snow

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **small**

Wind slabs require caution.

The wind slabs can be released by a single winter sport participant in particular on steep shady slopes. The avalanches are rather small. The avalanche prone locations are to be found especially adjacent to ridgelines above approximately 2400 m.

As a consequence of the snowfall, the likelihood of dry avalanches being released will increase a little on steep slopes above approximately 1800 m. The avalanches in these regions are rather small.

Defensive route selection is important.

Snowpack

20 to 30 cm of snow, and even more in some localities, has fallen since Tuesday. 5 to 10 cm of snow will fall until the evening above approximately 1800 m. The southerly wind will transport the new snow significantly.

The new snow and wind slabs have bonded well with the old snowpack in all aspects. On sunny slopes as well as at low altitude from a snow sport perspective, insufficient snow is lying.

Tendency

Sunday: Slight increase in danger of dry avalanches as a consequence of the snowfall.
