

## Danger Level 2 - Moderate

**Tendency: Constant avalanche danger** →  
on Wednesday 10 04 2024

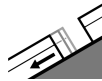

Wind slab

Snowpack stability: **poor**

Frequency: **some**

Avalanche size: **small**

Gliding snow

Snowpack stability: **very poor**

Frequency: **few**

Avalanche size: **small**

Fresh wind slabs represent the main danger.

As a consequence of new snow and a moderate northerly wind, clearly visible wind slabs will form during the course of the night. These can in some places be released by people, but they will be small in most cases. The avalanche prone locations are to be found in all aspects above approximately 2000 m. Gliding avalanches can also occur at any time.

### Snowpack

The surface of the snow cover is brown due to the effect of the Sahara dust. 10 cm of snow will fall during the night above approximately 2000 m. 20 cm of snow will fall until Wednesday above approximately 1800 m. The moderate wind will transport the new snow. The danger of moist avalanches will decrease gradually.

### Tendency

Wednesday: The danger of dry slab avalanches will not decrease for the time being.
