

Danger Level 3 - Considerable

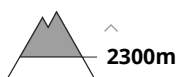

Tendency: Constant avalanche danger →

on Thursday 17 April 2025

Wind slab

Snowpack stability: **very poor**

Frequency: **some**

Avalanche size: **medium**

New snow

Snowpack stability: **very poor**

Frequency: **some**

Avalanche size: **medium**

New snow and wind slabs are to be assessed with care and prudence.

As a consequence of new snow and a light to moderate wind from northerly directions, wind slabs will form especially adjacent to ridgelines and in gullies and bowls as well as at elevated altitudes. In many cases avalanches are medium-sized and easily released. Small to medium-sized dry snow slides and avalanches are to be expected in particular in steep rocky terrain.

Careful route selection is recommended.

Snowpack

Wednesday: The weather will be cloudy. 20 to 30 cm of snow, and even more in some localities, will fall until the afternoon. The wind will be moderate adjacent to ridgelines.

The old snowpack will become in most cases well bonded. In some places new snow is lying on old snow containing large grains.

Tendency

The avalanche danger will not decrease for the time being.
