

Danger Level 2 - Moderate

Tendency: Decreasing avalanche danger
on Saturday 29 November 2025

Persistent weak layer

Snowpack stability: **poor**
Frequency: **some**
Avalanche size: **medium**

Wind slab

Snowpack stability: **poor**
Frequency: **some**
Avalanche size: **medium**

Gliding snow

Frequency: **some**
Avalanche size: **medium**

Wind slabs and weakly bonded old snow are to be assessed with care and prudence.

Weak layers in the lower part of the snowpack can be released by people on shady slopes. In these aspects the avalanches are medium-sized. Released avalanches and whumpung sounds confirm this situation.

The more recent wind slabs can be released by a single winter sport participant at intermediate and high altitudes. The avalanches are rather small. Medium-sized avalanches are further not ruled out.

As a consequence of warming gliding avalanches and moist snow slides are to be expected.

Careful route selection is recommended.

Snowpack

Shady slopes intermediate and high altitudes: Towards its base, the snowpack is faceted.

On Friday it will be partly cloudy.

Especially low and intermediate altitudes,: The surface of the snowpack will soften during the day. In particular at elevated altitudes snow depths vary greatly, depending on the influence of the wind.

Tendency

The avalanche activity will slowly increase.
